a

**EVENT (2026-09-24): anchor gene-row identity recovered mid-freeze — all anchor-arm numbers re-run before submission**

exmat row j == j-th fData row under upper-cased symbol alphabetical sort; verification gates PASS (sex anchor, mirror 31085/31085 numeric identity, cross-cohort ρ 0.81/0.62); wrong-identity archives (v60/v71/v74/v75 anchor values) stay frozen as provenance of the error and are superseded by the v82_rerun series

**Locked analysis parameters (v82 freeze, unchanged by the recovery)**

global seed = 20260911 (all v82 resampling)
AUC CI: 2000-rep bootstrap BCa
Efron 0.632: 600 bootstrap refits

M3/M6 recalibration: 100 stratified 50/50 repeats
external CI (ablation): percentile + BCa engines
ridge λ: 1/n_train external, 1/N_total within (re-ruled)

no number in any figure is typed: all read from frozen JSON keys (recovered-identity values only)

any change to a frozen input requires a new version directory, not an edit
