a Eight strategies x three targets:
24/24 transport refusals (recovered identity)

two-criterion rule: AUC 95% CI excludes 0.5
in the beneficial direction AND |slope − 1| ≤ 0.10 (logit);
M0 constant → slope not estimable

b Simpler reference strategies:
none is licensable either

AUC CI spans 0.5 AUC CI excludes 0.5 (benef.)

different estimand from panel a: single-source frozen transports (no LOCO re-training).
C_main/C_sex: ridge clinical models frozen on IMvigor210 n = 298; Ayers: IFN-γ 6-gene frozen score.
GSE165252 facet: both clinical models degenerate to the train-prevalence constant 0.228 — AUC 0.500 by construction (GEO deposits no covariates). All rows FAIL the two-criterion rule (frozen adjudication).
